Carboxy terminal end of RacORI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The solubbe expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

Claim 22; Page 67; 71pp; English.

The present sequence is a recombinant Rana catesbeiana oocyte ribonuclease (RaCOR1) protein with GlniSer. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a Liz antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells.

Strydom D.J., Bond M.D., Vallee B.L.,
"An angiogenic protein from bovine serum and milk -- purification and primary structure of angiogenin-2.";

Eur. J. Blochem. 247:535-544(1997).
-- FUNCTION: Binds tightly to placental ribonuclease inhibitor and has very low ribonuclease activity. Has potent angiogenic activity. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs.
-- TISSUE SPECIFICITY: Serum and milk.
-- SIMILARITY: Belongs to the pancreatic ribonuclease family.
HSSP: P10152: 1AGI.

1. Eur. J. Biochem. 219:641-646(1994).
2. CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphooligonucleotides ending in C-P or U-P with 2',3'-cyclic phosphate intermediates.
2. SUBCELIDIAR LOCATION: Secreted.
3. SUBCELIDIAR LOCATION: Secreted.
4. SIMILARITY: Belongs to the pancreatic ribonuclease family.

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2', 3'-cyclic phosphate intermediates.

-!- SUBCELLULAR LOCATION: Secreted.
-!- TASUE SERECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family. PIR; A92071; NRPG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                Biochim. Biophys. Acta 1162:177-186 (1993).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SMART; SM00092; RNASe_Pc; 1.

                                  Mol. Cell. Biol. 17:1503-1512(1997).
-!- FUNCTION: Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   ProDom; FDUVOSS, RNASE PC; 1.

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2'.3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family. PIR, 2X0085, 7X0085.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        82
residues with a 3'flanking guanine. Hydrolyzes poly(U) and poly(C) as substrates, and prefers the former. The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin agglinates various animal cells, including normal lymphocyces, erythrocytes, and fibroblasts of animal and human origin. It is cytotoxic against several tumor cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PDB; 1BC4; 28-OCT-98.

                                                                                                                                                                                                                                                                                        -i- FUNCTION: The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin preferentially agglutinate a large variety of tumor cells, but it does not agglutinate non-transformed cells and erythrocytes.
-i- SUBGNIT: Monomer.
-i- SUBCELLULAR LOCATION: Secreted.
-i- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE=Liver;

A; Title: The primary structure of porcine pancreatic ribonuclease. III. The A; Reference number: A92072; MUID:70104198; PMID:4904878
A; Contents: annotation; disulfide bonds
G; Superfamily: pancreatic ribonuclease
G; Keywords: glycoprotein; hydrolase; nucleic acid digestion; pancreas
F; 12, 41, 119/Active site: His, Lys, His #status predicted
F; 12, 34, 76/Binding site: carbohydrate (Asn) (covalent) #status experimental
F; 26-84, 40-95, 58-110, 65-72/Disulfide bonds: #status experimental
                             NyAlternate names: RNase 17, Names 17, Names 18, State names: RNase 17, RNase A C; Species: Sus scrofa domestica (domestic pig)
C; Species: Sus scrofa domestica (domestic pig)
C; Species: A-Apr-1984 #sequence_revision 24-Apr-1984 #text_change 03-Jun-1994

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

; Sequence 8, Application US/08875811
; Patent No. 6045793
; GENERAL INFORMATION:
; APPLICANT: Rybak, Susanna M.
APPLICANT: Newton, Dianne L.
; APPLICANT: Woldawer, Alexander
TITLE OF INVENTION: Recombinant Ribonuclease Proteins
INUMBER OF SEQUENCES: 64
CORRESPONDENCE ADDRESS:
; ADDRESSEE: Townsend and Townsend and Crew LLP
; STREET: Two Embarcadero Center, Eighth Floor
; CITY: San Francisco
; STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COMPUTER READABLE FORM:

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met at position 1 and Gln2Ser. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form 45.9%; Score 277.5; DB 2; Length 105; 48.2%; Pred. No. 1.9e-23; Arive 16; Mismatches 33; Indels 9: Query Match Best Local Similarity Sequence 105 AA;

Rana pipiens Clone 5alb ribonuclease.

(first entry)

Rana pipiens ribonuclease Clone Salb, RaPLR1; covalently bound; RNase; LL2 antibody; ligand binding moietry; CD22; cancerous B cell; onconase; Kaposi's Sarcona; human chorionic gonadotrophin; hCG; cancer; recombinant ribonuclease; frog; signal peptide; cytotoxic fusion protein; autoimmune disease

Rana pipiens

```
The present sequence is a Rana pipiens Clone Salb ribonuclease (RaPLRI). It is encoded by Clone Salb cDNA obtained from Rana pipiens liver mRNA residues II, 20, 85 and 103. Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by becteria. The soluble expression of ribonucleases allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24 QDWLTFQKKHLTNTRDVDCNNIMSTNLF----HCKDKNTFIYSRPEPVKAICKGIIASKN 79

Rana pipiens liver ribonuclease (RaPLR1)

25-JAN-2000 (first entry)

```
This sequence represents recombinant frog Onconase. Onconase has ribonuclease and anti-tumour activity. The CDNA was produced via PCR cusing primers AA219769 of two synthetic DNAS whose sequences cancoded most of the N-terminal or the C-terminal amino acids of mature or acids (minus the initial methionine) or the C-terminal 51 amino acids, and were ligated in frame at an Nrul site. The CDNA was then caids, and were ligated in frame at an Nrul site. The CDNA was then caids, and were ligated in Frame at an Nrul site. The CDNA was then caids, and were ligated to the CDNA. After expression in E coli, the recombinant comparable of the CDNA. After expression in E coli, the recombinant control of the CDNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli, the recombinant control of the DNA. After expression in E coli of the DNA. After expression is a colidated as a result of potent inhibition of protein synthesis by a manualian placental ribonuclease inhibitor, which may explain its manualian placental ribonuclease inhibitor, which may explain its continuity against a variety of solid tumours e.g. colon or pancreatic cancers, and can be used alone or in combination with other anti-tumour can be conjugated to a marker which targets it to a specific cell type
                                                                                                                          Ribonuclease; protein synthesis; inhibition; cancer; cytotoxic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A new recombinant Onconase used to treat, e.g. colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                   ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                     Leung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; Fig 1; 42pp; English.

RESULT 13 AAY28865

AAY28865 standard; protein; 104 AA.

Recombinant Met (-1) Rana pipiens ribonuclease Glniser; RaplR1; CD22; Covalently bound; LL2 antibody; ligand binding moiety; cancerous B ce. Raposi: s sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog; autoimmune disease; RNase.

Recombinant Met(-1) RaPLR1 Gln1Ser amino acid sequence.

```
The present sequence is Rana pipiens liver ribonuclease (RaPLR1) protein. Carboxy terminal end of RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer
                                                                   Rana pipiens liver ribonuclease, RaPLR1; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; Kaposi's Sarcoma; frog; human chorionic gonadotrophin; hCG; recombinant ribonuclease; RNase; signal peptide; cytotoxic fusion protein; cancer; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                           (USSH ) US DEPT HEALTH & HUMAN SERVICES.

This is one of two preferred proteins (the other in AAW06543) that have been isolated from Rana pipiens ocytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the

Carboxy terminal end of recombinant RaPLRI has a devalently bound ligand binding molety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionin due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

                                                                                                                                                                                                                                        The present sequence is a recombinant Rana pipiens ribonuclease protein (RaPLR1) with Met at position 1 attached to (His)6 tag and Met24Leu. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi, s sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              'note= "(His)6 histidine tag attached to N-terminal Met"

Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to britain with ligand binding moieties to form cytotoxic fusion diseases. They can be used for treatment of cancer and autoimmune diseases

```
The present sequence is a recombinant Rana catesbeiana oocyte ribonuclease (RaCOR1) protein with GlnISer. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  covalently bound; LL2 antibody; ligand binding moiety; cancerous B cell; bullfrog; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; RNase; signal peptide; recombinant ribonuclease; cytotoxic fusion protein;

autoimmune diseases

Sequence 110 AA;

```
This invention describes a novel nucleic acid construct comprising sequences encoding functional pancreatic RNase and a second protein (preferably the light and heavy chains of an antibody) which binds a specific cell surface marker on a target cell and functions as a specific agent. The products can be used for selectively killing cells expressing a specific surface marker. They can be used for treating tumors or infected cells (e.g. cells infected by viruses (especially latent or chronic virus infections, such as human immunodeficiency virus (eff'y)-1, Especial-Barr virus, herpes viruses (herpes simplex types I and II), hepatitis viruses (B, non-A-non-B, and delta), herpes zoster.

CYCOMEGALOVIUS)) and cells infected with parasites (such as the malaria cyromegalovirus)) and cells infected with parasites (such as the malaria parasite)). They can also be used for treating immune dysfunctional cells in immune and autoimmune diseases. Additionally, they may be used as contraceptives. Finally they can also be used for cell separation in vitro by selectively killing unwanted types of cells (e.g. in bone marrow) prior to transplantation into a patient undergoing marrow ablation by radiation or for killing leukemia cells or T-cells that would cause graft-versus-host disease. This sequence represents a bullfrog

0;
end of recombinant RacOR1 has a covalently bound ligand binding moiety, which can be a Li2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methiconine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of tibonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

Carboxy terminal end car recombinant RaCORI has a covalently bound ligand binding molety, which can be a Lu2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Netrinian methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

The present sequence is a Rana catesbeiana oocyte ribonuclease (RaCOR1) protein encoded by a cDNA modified for expression in E. coli. Carboxy terminal end of RaCOR1 has a covalently bound ligand binding moiety, which can be a LiZ antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma edlls. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form

for

New recombinant ribonucleases, used for killing target cells, e.g. treating cancers, viral infections or autoimmune diseases.

WPI; 1999-610847/52.

```
ribonuclease (RaCCR1) protein with Met at position 1 attached to a (His)6 tag, Met23Leu and Met58Leu. Carboxy terminal end of recombinant RaCCR1 has a covalently bound ligand binding moiery, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

             end of recombinant RacOR1 has a covalently bound ligand binding modety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorizonic gonadotrophin (HCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside in phosphates and 3'-phosphooligonucleotides ending in C-P or With 2',3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUB SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

Biophys. Acta 1162:177-186 (1993).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothalial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothalial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PROSITE; PS00127; RNASE PANCREATIC; 1.

                                 Mol. Cell. Biol. 17:1503-1512(1997).

Mol. Cell. Biol. 17:1503-1512(1997).

-!- FUNCTION: Angiogenin induces vascularization of normal and malignant tissues. Angiolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
